State Issues Cyanobacteria Alert for Goose Pond in Canaan/Hanover, New Hampshire

Concord, NH- A cyanobacteria bloom has been observed on Goose Pond. The bloom was first reported on June 17, appearing as bright, blue-green clouds near shorelines of the lake. This alert is intended as a message to inform the community of the bloom. This is not an official advisory since samples have not been collected by NHDES yet.

Surface blooms can rapidly change and accumulate in various locations around a waterbody. As a result, the New Hampshire Department of Environmental Services (NHDES) has issued a cyanobacteria alert for those who use the waterbody for recreation. Please continue to monitor your individual shorelines for changing conditions and avoid contact. The alert is not based on a toxin evaluation and is intended as a precautionary measure for short term exposure.

NHDES advises lake users to avoid contact with the water in areas experiencing elevated cyanobacteria cell conditions, also known as a bloom. NHDES also advises pet owners to keep their pets out of any waters that have a cyanobacteria bloom.

Cyanobacteria are natural components of water bodies worldwide, though blooms and surface scums may form when excess nutrients are available to the water. Some cyanobacteria produce toxins that are stored within the cells and released upon cell death. Toxins can cause both acute and chronic health effects that range in severity. Acute health effects include irritation of skin and mucous membranes, tingling, numbness, nausea, vomiting, seizures and diarrhea. Chronic effects may include liver and central nervous system damage. Be cautious of lake water that has a surface scum, changes colors, or appears to have green streaks or blue-green flecks aggregating along the shore.

Visit the NHDES Beach Program website for photos and more information about cyanobacteria at:
