Despite our best efforts mentioned earlier to control water corrosivity and remove lead from the water supply, lead levels in some homes or buildings can be high. To find out whether you need to take action in your own home, have your drinking water tested to determine if it contains excessive concentrations of lead. Testing the water is essential because you cannot see, taste or smell lead in drinking water. Some local laboratories that can provide this service are listed at the end of this brochure. For more information on having your water tested, please call 643-3439.

If a water test indicates that the drinking water drawn from a tap in your home contains lead levels above 15 ppb, then you should take the following precautions:

**Let the water run from the tap before using it for drinking or cooking any time the water in the faucet has gone unused for more than six hours.** The longer the water resides in your home’s plumbing, the more lead it may contain. Flushing the tap means running the cold water faucet until the water gets noticeably colder, usually about 15-30 seconds. If your house has a lead service line to the water main, you may have to flush the water for a longer time, perhaps one minute, before drinking. Although toilet flushing or showering flushes water through a portion of your home’s plumbing system, you still need to flush the water in each faucet before using it for drinking or cooking. Flushing tap water is a simple and inexpensive measure you can take to protect your family’s health. It usually takes less than one or two gallons of water and costs less than 20 cents per month. To conserve water, fill a couple of bottles for drinking water after flushing the tap, and whenever possible use the first flush water to wash dishes or to water the plants. If you live in a high-rise building, letting the water flow before using it may not work to lessen your risk from lead. These plumbing systems have more and sometimes larger pipes than smaller buildings. Ask your landlord for help in locating the source of lead and for advice on reducing the lead level.

**Try not to cook with, or drink water from the hot water tap.** Hot water can dissolve more lead more quickly than cold water. If you need hot water, draw from the cold-water tap and heat it on the stove.
Remove loose lead solder and debris from the plumbing materials installed in newly constructed homes, or homes in which the plumbing has been recently replaced, by removing the faucet strainers from all taps and running the water from three to five minutes. Thereafter, periodically remove the strainers and flush out any debris that has accumulated over time.

If your copper pipes are joined with lead solder that has been installed illegally since it was banned in 1986, notify the plumber who did the work and request that he or she replace the lead solder with lead-free solder. Lead solder looks dull gray, but when scratched with a key, looks shiny. In addition, notify the Water Supply Engineering Bureau of the Department of Environmental Services in Concord about the violation.

Determine whether or not the service line that connects your home or apartment to the water main is made of lead. The best way to determine if your service line is made of lead is by either hiring a licensed plumber to inspect the line or by contacting the plumbing contractor who installed the line. You can identify the plumbing contractor by checking the town’s record of building permits which should be maintained in the files of the Town of Hanover Code Department. A licensed plumber can at the same time check to see if your home’s plumbing contains lead solder, lead pipes or pipe fittings that contain lead. The public water system that delivers water to your home should also maintain records of the materials located in the distribution system. If the service line that connects your dwelling to the water main contributes more than 15 ppb of lead to drinking water, after our comprehensive treatment program is in place, we are required to replace lead. If the line is only partially owned by Hanover Water Works Co., we are required to provide the owner of the privately-owned portion of the line with information on how to replace the privately-owned portion of the service line, and offer to replace that portion of the line at the owner’s expense. If we replace only the portion of the line that we own, we also are required to notify you in advance and provide you with information on the steps you can take to minimize exposure to any temporary increase in lead levels that may result from the partial replacement, to take a follow-up water sample at our expense from the line within 72 hours after the partial replacement, and to mail or otherwise provide you with the results of that sample within 3 business days of receiving the results. Acceptable replacement alternatives include copper, steel, iron and plastic pipes.

Have a licensed electrician check your wiring. If grounding wires from the electrical system are attached to your pipes, corrosion may be greater. Check with a licensed electrician or your local electrical code to determine if your wiring can be grounded elsewhere. DO NOT attempt to change the wiring yourself because improper grounding can cause electrical shock and fire hazards.

ADDITIONAL STEPS YOU CAN TAKE

The steps described above will reduce the lead concentrations in your drinking water. However, if a water test indicates that the drinking water coming from your tap contains lead concentrations in excess of 15 ppb after flushing, or after we have completed our actions to minimize lead levels, then you may want to take the following additional measures:

Purchase or lease a home treatment device. Home treatment devices are limited in that each unit treats only the water that flows from the faucet to which it is connected, and all of the devices require periodic maintenance and replacement. Devices such as reverse osmosis systems or distillers can effectively remove lead from your drinking water. Some activated carbon filters may reduce lead levels at the tap. However, all lead reduction claims should be investigated. Be sure to check the actual performance of a specific home treatment device before and after installing the unit.

Purchase bottled water for drinking and cooking.

ADDITIONAL INFORMATION

You can consult a variety of sources for additional information. Your family doctor or pediatrician can perform a blood test for lead and provide you with information about the health effects of lead. State and local government agencies that can be contacted include:

The NHIDES WATER SUPPLY ENGINEERING BUREAU at 603-271-3139 can provide you with information about your community’s water supply, and a list of local laboratories that have been certified by the EPA for testing quality.

The Town of Hanover Code Department at 643-0708 can provide you with information about building permit records that should contain the names of plumbing contractors that plumbed your home, and

The Health Risk Assessment Unit of the NH DEPARTMENT OF PUBLIC HEALTH at 271-4664 can provide you with information about the health effects of lead and how you can have your child’s blood tested.

DEPARTMENT-APPROVED LABORATORIES

The following is a list of some department-approved laboratories in your area that you can call to have your water tested for lead.

Eastern Analytical Inc.
25 Chenell Drive
Concord, NH 03301
(603) 228 – 0525

Fall Mountain Water Testing Inc
Charlestown, NH
826-5032

05/08
